(54) Title: FUSED AZOLE-PYRIMIDINE DERIVATIVES

(57) Abstract: The present invention relates to novel fused azolepyrimidine derivatives, processes for preparing them and pharmaceutical preparations containing them. The fused azolepyrimidine derivatives of the present invention exhibit enhanced potency for phosphatidylinositol-3-kinase (PI3K) inhibition, especially for PI3K- γ inhibition and can be used for the prophylaxis and treatment of diseases associated with PI3K and particularly with PI3K- γ activity. More specifically, the azole derivatives of the present invention are useful for treatment and prophylaxis of diseases as follows: inflammatory and immunoregulatory disorders, such as asthma, atopic dermatitis, rhinitis, allergic diseases, chronic obstructive pulmonary disease (COPD), septic shock, joint diseases, autoimmune pathologies such as rheumatoid arthritis, and Graves' disease, cancer, myocardial contractility disorders, heart failure, thromboembolism, ischemia, and atherosclerosis. The compounds of the present invention are also useful for pulmonary hypertension, renal failure, cardiac hypertrophy, as well as neurodegenerative disorders such as Parkinson's disease, Alzheimer's disease, diabetes and focal ischemia, since the diseases also relate to PI3K activity in a human or animal subject.

FUSED AZOLE-PYRIMIDINE DERIVATIVES**DETAILED DESCRIPTION OF INVENTION**

5

Technical Field

The present invention relates to novel fused azolepyrimidine derivatives, processes for preparing them and pharmaceutical preparations containing them. The fused
10 azolepyrimidine derivatives of the present invention exhibit enhanced potency for phosphatidylinositol-3-kinase (PI3K) inhibition, especially for PI3K- γ inhibition and can be used for the prophylaxis and treatment of diseases associated with PI3K and particularly with PI3K- γ activity.

15 More specifically, the fused azolepyrimidine derivatives of the present invention are useful for treatment and prophylaxis of diseases as follows: inflammatory and immunoregulatory disorders, such as asthma, atopic dermatitis, rhinitis, allergic diseases, chronic obstructive pulmonary disease (COPD), septic shock, joint
20 diseases, autoimmune pathologies such as rheumatoid arthritis, and Graves' disease, cancer, myocardial contractility disorders, heart failure, thromboembolism, ischemia, and atherosclerosis.

The compounds of the present invention are also useful for pulmonary hypertension, renal failure, cardiac hypertrophy, as well as neurodegenerative disorders such as
25 Parkinson's disease, Alzheimer's disease, diabetes and focal ischemia, since the diseases also relate to PI3K activity in a human or animal subject.

BACKGROUND ART

30 Signal transduction pathways originating from chemoattractant receptors are considered to be important targets in controlling leukocyte motility in inflammatory

- 2 -

diseases. Leukocyte trafficking is controlled by chemoattractant factors that activate heterotrimeric G-protein coupled receptors (GPCRs) and thereby trigger a complex variety of downstream intracellular events. Signal transduction at one of the pathways, that results in mobilization of intracellular free Ca^{2+} , cytoskeletal reorganisation, and directional movement depends on lipid-derived second messengers produced by phosphoinositide 3-kinase (PI3K) activity [1,2].

PI3K phosphorylates the D3-hydroxyl position of the membrane phospholipid phosphatidylinositol-4,5-bisphosphate ($\text{PtdIns}(4,5)\text{P}_2$) to yield phosphatidylinositol-3,4,5-trisphosphate ($\text{PtdIns}(3,4,5)\text{P}_3$). Based on substrate specificity and protein structure, the PI3K family comprises three classes [4-6]. Of particular interest in leukocyte migration are class I PI3Ks, which are all involved in receptor-induced inflammatory cellular responses and are further divided into the subclasses IA ($\text{p110}\alpha, \beta, \delta$) and IB ($\text{p110}\gamma$).

Class IA enzymes ($\text{p110}\alpha, \beta, \delta$) associate with a p85 adapter subunit, which contains two SH2 domains, to form a heterodimeric complex. This complex is able to recognize phosphotyrosine YxxM motifs, resulting in association with receptor tyrosine kinases and subsequent activation of the enzyme through receptor tyrosine kinases [1, 2]. The class IA subtypes are considered to be associated with cell proliferation and carcinogenesis. The IA subtypes bind to activated ras oncogene, which is found in many cancers, to express their enzyme activity. It has also found that both $\text{p110}\alpha$ and β play important roles in human cancer growth [3].

Class IB ($\text{p110}\gamma$) enzyme, whose expression is largely confined to leukocytes, is activated by the G protein $\beta\gamma$ complex, and functions downstream of seven transmembrane chemoattractant receptors [7-9]. The p101 adapter protein, which bears no resemblance to any other known protein, is essential for the G protein $\beta\gamma$ responsiveness of the $\text{p110}\gamma$ (PI3K γ). [10-12].

- 3 -

Recent studies in mice lacking functional PI3K γ (PI3K γ ^{-/-} mice), which were viable, fertile, and displayed a normal life span in a conventional mouse facility, have revealed that neutrophils are unable to produce PtdIns(3,4,5)P₃ when stimulated with GPCR agonists such as fMLP, C5a or IL-8. This demonstrates that PI3K γ is the sole
5 PI3K that is coupled to these GPCRs in these cells [13-16]. Moreover, PtdIns(3,4,5)P₃-dependent activation of protein kinase B (PKB) was also absent in those neutrophils, while PKB could still be activated by GM-CSF or IgG/C3b-coated zymosan via either p110 α , β or δ . At the same time, G-protein-mediated responses such as PLC β activation were intact. PI3K γ ^{-/-} mice showed impaired thymocyte
10 development and increases in neutrophil, monocyte, and eosinophil populations [14]. Furthermore, neutrophils and macrophages isolated from PI3K γ ^{-/-} mice exhibited severe defects in migration and respiratory burst in response to GPCR agonists and chemotactic agents [14,16]. Expression of PI3K γ was also examined in transgenic mice expressing green fluorescence protein (GFP) under the control of the
15 endogenous PI3K γ promoter. GFP was detected in spleen and bone marrow cells, and neutrophils, suggesting that the expression of PI3K γ is restricted to hematopoietic cells [15]. Collectively, the class IB phosphoinositide 3-kinase PI3K γ seems to be pivotal in the control of leukocyte trafficking and accordingly the development of isotype-selective inhibitors of PI3K γ should be an attractive anti-inflammatory
20 strategy.

Hypertrophic responses can be initiated by PI3K signaling pathways. Currently new research was published which identify a function for PTEN- PI3K γ pathway in the modulation of heart muscle contractility. Whereas PI3K α mediates the alteration in
25 cell size seen during heart hypertrophy up to heart failure, PI3K γ acts as a negative regulator of cardiac contractility.

PTEN is a dual-specificity protein phosphatase recently implicated as a phosphoinositide phosphatase in cellular growth signaling. The tumor suppressor PTEN is shown to dephosphorylate phosphatidylinositol 3,4,5-triphosphate (PIP₃) which is an
30 important second messenger generated specifically by the actions of PI3K. The

- 4 -

PTEN reduces the levels of PIP3 within the cells and antagonizes PI3K mediated cellular signaling. It is also reported that expression of dominant-negative PTEN in rat cardiomyocytes in tissue culture results in hypertrophy.

5 PI3K γ modulates baseline cAMP levels and controls contractility in cells. This study also indicates that alterations in baseline cAMP level contribute to the increased contractility in mutant mice [17].

10 Therefore, this research result shows that PI3K γ is involved in myocardial contractility and therefore the inhibitors would be potential treatments of congestive heart failure, ischemia, pulmonary hypertension, renal failure, cardiac hypertrophy, atherosclerosis, thromboembolism, and diabetes.

15 A inhibitor of PI3K, which is expected to block signaltransduction from GPCR and the activation of various immune cells, should have a broad anti-inflammatory profile with potential for the treatment of inflammatory and immunoregulatory disorders, [2] including asthma, atopic dermatitis, rhinitis, allergic diseases, chronic obstructive pulmonary disease (COPD), septic shock, joint diseases, autoimmune pathologies such as rheumatoid arthritis, and Graves' disease, diabetes, cancer, myocardial
20 contractility disorders, thromboembolism [18], and atherosclerosis.

Some PI3-kinase inhibitors has been identified: wortmannin, originally isolated as a fungal toxin from *Penicillium wortmannii* [19], the closely related but less well characterized demethoxyviridin and LY294002, a morpholino derivative of the
25 broad-spectrum kinase inhibitor quercetin [20].

US 3644354 discloses 5-substituted 2,3, dihydroimidazo[1,2-c]quinazolines represented by the general formula:

- 5 -

wherein R and R⁰ is independently, hydrogen, lower alkyl, lower alkenyl; R' and R'' are independently, hydrogen, halogen, lower alkyl, lower alkoxy

5 or

as a hypotensive agents and coronary dilators

10 However, none of the references discloses fused azolepyrimidine such as, but not limited to, azole-quinazoline, azole-pyridopyrimidine, azole-pyrimidopyrimidine, azole-pyrimidopyridazine, azole-pyrimidotriazine, azole-pteridine, azole-pyrimido-tetrazine and other derivatives having acylated amine or -CR⁵R⁶-C(O)- (R⁵ is hydrogen or C₁₋₆ alkyl and R⁶ is halogen, hydrogen, or C₁₋₆ alkyl) linker at the 5 or 6 position of the fused azolepyrimidine also having PI3K inhibitory activity.

15

The development of a compound which is useful for treatment and prophylaxis of inflammatory, cancer and/or myocardial contractility disorders associated with PI3K activity has been still desired.

20 Summary of the invention

As a result of extensive studies on chemical modification of the fused azolepyrimidine derivatives, the present inventors have found that the compounds of novel

- 6 -

chemical structure related to the present invention have PI3K inhibitory activity and particularly have PI3K- γ inhibitory activity. The present invention has been accomplished based on these findings.

- 5 This invention is to provide novel fused azolepyrimidine derivatives of the formula (I) their tautomeric and stereoisomeric forms, and salts thereof.

Alkyl per se and "alk" and "alkyl" in alkane, alkoxy, alkanoyl, alkylamino, alkylaminocarbonyl, alkylaminosulphonyl, alkylsulphonylamino, alkoxycarbonyl, alkoxy-carbonylamino and alkanoylamino represent a linear or branched alkyl radical having

15 generally 1 to 6, preferably 1 to 4 and particularly preferably 1 to 3 carbon atoms, representing illustratively and preferably methyl, ethyl, propyl, isopropyl, isobutyl, tert-butyl, sec-butyl, pentyl, n-hexyl, and the like.

Alkylene represents the divalent linear or branched saturated hydrocarbon radical,

20 consisting solely of carbon and hydrogen atoms, having generally 1 to 6 carbon preferably 1 to 4 and particularly preferably 1 to 3 carbon atoms, representing illustratively and preferably methylene, ethylene, 2-methyl-propylene, butylene, 2-ethylbutylene and the like.

25 Alkoxy illustratively and preferably represents methoxy, ethoxy, n-propoxy, isopropoxy, tert-butoxy, n-pentoxy, n-hexoxy and the like.

Alkylamino represents an alkylamino radical having one or two (independently selected) alkyl substituents, illustratively and preferably representing methylamino,

30 ethylamino, n-propylamino, isopropylamino, tert-butylamino, n-pentylamino, n-hexyl-amino, N,N-dimethylamino, N,N-diethylamino, N-ethyl-N-methylamino, N-

methyl-N-n-propylamino, N-isopropyl-N-n-propylamino, N-t-butyl-N-methylamino, N-ethyl-N-n-pentylamino, N-n-hexyl-N-methylamino and the like.

Alkylaminocarbonyl represents an radical having one or two (independently selected) alkyl substituents, illustratively and preferably representing methylaminocarbonyl, ethylaminocarbonyl, n-propylaminocarbonyl, isopropylamino-carbonyl, tert-butylaminocarbonyl, n-pentylaminocarbonyl, n-hexylaminocarbonyl, N,N-dimethylaminocarbonyl, N,N-diethylaminocarbonyl, N-ethyl-N-methylaminocarbonyl, N-methyl-N-n-propylaminocarbonyl, N-isopropyl-N-n-propylaminocarbonyl, N-t-butyl-N-methylaminocarbonyl, N-ethyl-N-n-pentylamino-carbonyl, N-n-hexyl-N-methylaminocarbonyl and the like.

Alkylaminosulphonyl represents an alkylaminosulphonyl radical having one or two (independently selected) alkyl substituents, illustratively and preferably representing methylaminosulphonyl, ethylaminosulphonyl, n-propylaminosulphonyl, isopropylaminosulphonyl, tert-butylaminosulphonyl, n-pentylaminosulphonyl, n-hexylaminosulphonyl, N,N-dimethylaminosulphonyl, N,N-diethylaminosulphonyl, N-ethyl-N-methylamino-sulphonyl, N-methyl-N-n-propylaminosulphonyl, N-isopropyl-N-n-propylaminosulphonyl, N-t-butyl-N-methylaminosulphonyl, N-ethyl-N-n-pentylaminosulphonyl, N-n-hexyl-N-methylaminosulphonyl and the like.

Alkylsulphonyl illustratively and preferably represents methylsulphonyl, ethylsulphonyl, n-propylsulphonyl, isopropylsulphonyl, tert-butylsulphonyl, n-pentylsulphonyl, n-hexylsulphonyl and the like.

Alkoxy-carbonyl illustratively and preferably represents methoxy-carbonyl, ethoxy-carbonyl, n-propoxy-carbonyl, isopropoxy-carbonyl, tert-butoxy-carbonyl, n-pentoxycarbonyl, n-hexoxycarbonyl and the like.

Alkoxy-carbonylamino illustratively and preferably represents methoxy-carbonylamino, ethoxy-carbonylamino, n-propoxy-carbonylamino, isopropoxy-carbonylamino,

tert-butoxycarbonylamino, n-pentoxycarbonylamino, n-hexoxycarbonylamino and the like.

5 Alkanoylamino illustratively and preferably represents acetamido, ethylcarbonylamino and the like.

Cycloalkyl per se and in cycloalkylamino and in cycloalkylcarbonyl represents a cycloalkyl group having generally 3 to 8 and preferably 5 to 7 carbon atoms, illustratively and preferably representing cyclopropyl, cyclobutyl, cyclopentyl, 10 cyclohexyl, cycloheptyl and the like.

Aryl per se and "aryl" in arylamino, arylcarbonyl, alkoxyaryl, represents a mono- to tricyclic aromatic carbocyclic radical having generally 6 to 14 carbon atoms, illustratively and preferably representing phenyl, naphthyl, phenanthrenyl and the 15 like.

Arylamino represents an arylamino radical having one or two (independently selected) aryl substituents, illustratively and preferably representing phenylamino, diphenylamino, naphthylamino and the like.

20 Heteroaryl per se and "heteroaryl" in heteroarylamino and heteroarylcarbonyl represents an aromatic mono- or bicyclic radical having generally 5 to 15 and preferably 5 or 6 ring atoms and up to 5 and preferably up to 4 hetero atoms selected from the group consisting of S, O and N, illustratively and preferably representing thienyl, 25 furyl, pyrrolyl, thiazolyl, oxazolyl, imidazolyl, thiazolyl, pyrazinyl, pyridinyl, pyrimidinyl, pyridazinyl, thiophenyl, indolyl, isoindolyl, indazolyl, benzofuranyl, benzothiophenyl, quinolinyl, isoquinolinyl, 1,3 benzodioxole, benzofuranyl, benzofuran-2,5-diyl, benzofuran-3,5-diyl, and the like.

30 Heterocyclic per se and heterocyclic ring per se represent a mono- or polycyclic, preferably mono- or bicyclic, nonaromatic heterocyclic radical having generally 4 to

10 and preferably 5 to 8 ring atoms and up to 3 and preferably up to 2 hetero atoms and/or hetero groups selected from the group consisting of N, O, S, SO and SO₂. The heterocyclyl radicals can be saturated or partially unsaturated. Preference is given to 5- to 8-membered monocyclic saturated heterocyclyl radicals having up to two hetero
5 atoms selected from the group consisting of O, N and S, such as illustratively and preferably tetrahydrofuran-2-yl, pyrrolidin-2-yl, pyrrolidin-3-yl, pyrrolinyl, piperidinyl, morpholino, perhydroazepinyl.

Heterocyclylcarbonyl illustratively and preferably represents tetrahydrofuran-2-
10 carbonyl, pyrrolidine-2-carbonyl, pyrrolidine-3-carbonyl, pyrrolinecarbonyl, piperidinecarbonyl, morpholinecarbonyl, perhydroazepinecarbonyl.

Halogen and Halo represents fluoro, chloro, bromo and/or iodo.

15 Further, the present invention provides a medicament which include one of the compounds described above and optionally pharmaceutically acceptable excipients.

EMBODIMENT OF INVENTION

20 The compound of the formula (I) of the present invention can be, but not limited to be, prepared by reactions described below. In some embodiments, one or more of the substituents, such as amino group, carboxyl group, and hydroxyl group of the compounds used as starting materials or intermediates are advantageously protected by a protecting group known to those skilled in the art. Examples of the protecting
25 groups are described in "Protective Groups in Organic Synthesis (3rd Edition)" by Greene and Wuts.

The compound of the formula (I) of the present invention can be, but not limited to be, prepared by the Method [A], and [B] below.

30

The compound of the formula (I-a):

- 27 -

5 (wherein R^1 , R^5 , R^6 , Y^1 , Y^2 , Y^3 , Z^1 , Z^2 , Z^3 and Z^4 are the same as defined above) can be, but not limited to be, prepared by the following Method A.

Method [A]

10 The compound of formula (I-a) can be prepared, for example, by the reaction of the compound of formula (II) (wherein Y^1 , Y^2 , Y^3 , Z^1 , Z^2 , Z^3 and Z^4 are the same as defined above) with a compound of formula (III) (wherein R^1 , R^5 and R^6 are the same as defined above, and L represents C_{1-6} alkyl).

15 The reaction may be carried out without solvent, or in a solvent including, for instance, ethers such as diethyl ether, isopropyl ether, dioxane and tetrahydrofuran (THF) and 1,2-dimethoxyethane; aromatic hydrocarbons such as benzene, toluene and xylene; amides such as N, N-dimethylformamide (DMF), N, N-dimethylacetamide and N-methylpyrrolidone; sulfoxides such as dimethylsulfoxide (DMSO);
20 alcohols such as methanol, ethanol, 1-propanol, isopropanol and tert-butanol; water, and others. Optionally, two or more of the solvents selected from the listed above can be mixed and used.

The reaction temperature can be optionally set depending on the compounds to be reacted. The reaction temperature is usually, but not limited to, about 10°C to 200°C and preferably about 50°C to 160°C. The reaction may be conducted for, usually, 10 minutes to 48 hours and preferably 30 minutes to 24 hours.

Preparation of the intermediates

The compound of formula (II') (wherein Y^1 , Z^1 , Z^2 , Z^3 and Z^4 are the same as defined above, Y^2 and Y^3 independently represent CR^3R^4 or NR^4 and are connected by single bond) and the compound of formula (II'') (wherein Y^1 , Z^1 , Z^2 , Z^3 and Z^4 are the same as defined above, Y^2 and Y^3 independently represent CH or N and are connected by double bond) can be, but not limited to be, prepared by the following Method [A-i].

Method [A-i]

15

In the step 1, the compound of formula (II') (wherein Y^1 , Z^1 , Z^2 , Z^3 and Z^4 are the same as defined above, Y^2 and Y^3 independently represent CR^3R^4 or NR^4 and are connected by single bond) can be prepared, for example, by the reaction of the compound of formula (VI) (wherein Z^1 , Z^2 , Z^3 and Z^4 are the same as defined above) with an diaminoalkane derivatives such as ethylenediamine.

20

The reaction can be advantageously carried out using appropriate dehydrating agents such as $SOCl_2$, $POCl_3$, P_2O_5 , P_2S_5 , CS_2 and others.

25

The reaction may be carried out without solvent, or in a solvent including for instance, ethers such as diethyl ether, isopropyl ether, dioxane and tetrahydrofuran

- 29 -

(THF) and 1,2-dimethoxyethane; aromatic hydrocarbons such as benzene, toluene and xylene and others. Optionally, two or more of the solvents selected from the listed above can be mixed and used.

5 The reaction temperature is usually, but not limited to, about 10°C to 200°C and preferably about 50°C to 200°C. The reaction may be conducted for, usually, 10 minutes to 48 hours and preferably 30 minutes to 24 hours.

10 In the step 2, the compound of formula (II'') (wherein Y^1 , Z^1 , Z^2 , Z^3 and Z^4 are the same as defined above, Y^2 and Y^3 independently represent CH or N and are connected by double bond) can be prepared, for example, from the compound of formula (II') (wherein Y^1 , Z^1 , Z^2 , Z^3 and Z^4 are the same as defined above, Y^2 and Y^3 independently represent CR^3R^4 or NR^4 and are connected by single bond) by the oxidation reaction using an agent such as MnO_2 , $KMnO_4$ and others, or by the
15 dehydrogenation reaction using palladium on carbon.

The reaction can be carried out in a solvent including, for instance, ethers such as diethyl ether, isopropyl ether, dioxane and tetrahydrofuran (THF) and 1,2-dimethoxyethane; aromatic hydrocarbons such as benzene, toluene and xylene; dimethyl-
20 formamide (DMF), dimethylacetamide (DMAC), 1,3-dimethyl-3,4,5,6-tetrahydro-2(1H)-pyrimidinone (DMPU), 1,3-dimethyl-2-imidazolidinone (DMI), N-methylpyrrolidinone (NMP), and others. Optionally, two or more of the solvents selected from the listed above can be mixed and used.

25 The reaction temperature is usually, but not limited to, about 0°C to 200°C and preferably about 50°C to 200°C. The reaction may be conducted for, usually, 30 minutes to 48 hours and preferably 2 hours to 24 hours.

The compound of formula (VI) is commercially available or can be synthesized by
30 conventional method.

The compound of formula (III) can be prepared, for example, by the following Method [A-ii].

Method [A-ii]

- 5 The compound of formula (III) (wherein L, R¹, R⁵ and R⁶ are the same as defined above) can be prepared by the reaction of the compound of formula (VII) (wherein R¹, R⁵ and R⁶ are the same as defined above) with the compound of formula (VIII) (wherein L is the same as defined above) in the presence of a base such as potassium hydride, potassium hexamethyldisilazide, and others.

10

The reaction can be carried out in a solvent including, for instance, ethers such as diethyl ether, isopropyl ether, dioxane and tetrahydrofuran (THF) and 1,2-dimethoxyethane; aromatic hydrocarbons such as benzene, toluene and xylene, dimethylformamide (DMF), dimethylacetamide (DMAC), 1,3-dimethyl-3,4,5,6-tetrahydro-
 15 2(1H)-pyrimidinone (DMPU), 1,3-dimethyl-2-imidazolidinone (DMI), N-methylpyrrolidinone (NMP), and others. Optionally, two or more of the solvents selected from the listed above can be mixed and used.

20 The reaction temperature is usually, but not limited to, about -100°C to 100°C. The reaction may be conducted for, usually, 30 minutes to 48 hours and preferably 2 hours to 12 hours.

Alternatively, the compound of formula (III) can be prepared, for example, by the following Method [A-iii].

- 31 -

Method [A-iii]

The compound of formula (III) (wherein L, R¹, R⁵ and R⁶ are the same as defined above) can be prepared by the reaction of the compound of formula (IX) (wherein R¹ is the same as defined above and L' is a leaving group such as halogen atom e.g., chlorine or bromine atom, or imidazole) with the compound of formula (X) (wherein L, R⁵ and R⁶ are the same as defined above) or its salts, for example, potassium salt.

The reaction can be carried out in the presence of Lewis acid including magnesium salts, such as magnesium bromide, magnesium chloride, magnesium iodide, magnesium acetate, and others or a base such as n-butyl lithium, sec-butyl lithium, and others. The reaction can be carried out in a solvent including, for instance, ethers such as diethyl ether, isopropyl ether, dioxane and tetrahydrofuran (THF) and 1,2-dimethoxyethane; aromatic hydrocarbons such as benzene, toluene and xylene, and others. Optionally, two or more of the solvents selected from the listed above can be mixed and used.

The preparation of the compound formula (I-b):

I-b

(wherein R^1 , Y^1 , Y^2 , Y^3 , Z^1 , Z^2 , Z^3 and Z^4 are the same as defined above) can be, but not limited to be, prepared by the following Method B.

Method [B]

- 5 The compound of formula (I-b) can be prepared, for example, by the reaction of the compound of formula (IV) (wherein Y^1 , Y^2 , Y^3 , Z^1 , Z^2 , Z^3 and Z^4 are the same as defined above) with a compound of formula (V) (wherein R^1 is the same as defined above and L'' is a leaving group, such as hydroxy; halogen atom e.g., chlorine, bromine, or iodine

- 10 atom; imidazole or,  wherein R^1 is the same as defined above). In the case L'' is hydroxy, the reaction can be advantageously carried out by using a coupling agent such as benzotriazole-1-yl-oxy-tris-pyrrolidino-phosphonium hexafluorophosphate (PyBOP), 1,1'-carbonyldi(1,3-imiazole)(CDI), 1,1'-carbonyldi(1,2,4-triazole)(CDT) and others.

- 15 In the case L'' is halogen atom, imidazole, or  the reaction can be advantageously conducted in the presence of a base, including, for instance, such as pyridine, triethylamine and N,N-diisopropylethylamine, dimethylaniline, diethylaniline, and others.

- 20 The reaction may be carried out without solvent, or in a solvent including, for instance, ethers such as diethyl ether, isopropyl ether, dioxane and tetrahydrofuran (THF) and 1,2-dimethoxyethane; aromatic hydrocarbons such as benzene, toluene and xylene; nitriles such as acetonitrile; amides such as N, N-dimethylformamide

- 33 -

(DMF), N, N-dimethylacetamide (DMAC) and N-methylpyrrolidone (NMP); urea such as 1,3-dimethyl-2-imidazolidinone (DMI); sulfoxides such as dimethylsulfoxide (DMSO); and others. Optionally, two or more of the solvents selected from the listed above can be mixed and used.

5

The reaction temperature is usually, but not limited to, about 40°C to 200°C and preferably about 20°C to 180°C. The reaction may be conducted for, usually, 30 minutes to 48 hours and preferably 2 hours to 12 hours.

Preparation of intermediates

The compound of formula (IV) can be, but not limited to be, prepared by the following Method [B-i]:

Method [B-i]

15

The compound of formula (IV) (wherein Y¹, Y², Y³, Z¹, Z², Z³ and Z⁴ are the same as defined above) can be prepared by the reaction of compound of formula (II) (wherein Y¹, Y², Y³, Z¹, Z², Z³ and Z⁴ are the same as defined above) with cyanogen halides such as cyanogen bromide.

20

The reaction may be carried out in a solvent including, for instance, ethers such as diethyl ether, isopropyl ether, dioxane and tetrahydrofuran (THF) and 1,2-dimethoxyethane; aromatic hydrocarbons such as benzene, toluene and xylene; amides such as N, N-dimethylformamide (DMF), N, N-dimethylacetamide and N-

methypyrrolidone; alcohols such as methanol, ethanol, 1-propanol, isopropanol and tert-butanol; and others. Optionally, two or more of the solvents selected from the listed above can be mixed and used.

- 5 The reaction temperature is usually, but not limited to, about -10°C to 200°C. The reaction may be conducted for, usually, 30 minutes to 48 hours and preferably 1 hour to 24 hours.

- 10 The compound of formula (II) (wherein Y¹, Y², Y³, Z¹, Z², Z³ and Z⁴ are the same as defined above) can be obtained in the same manner described in Method [A-i].

The compound of formula (VII), (VIII), (IX) and (X) are commercially available or can be synthesized by conventional method.

- 15 When the compound shown by the formula (I) or a salt thereof has an asymmetric carbon(s) in the structure, their optically active compounds and racemic mixtures are also included in the scope of the present invention.

- 20 Typical salts of the compound shown by the formula (I) include salts prepared by the reaction of the compound of the present invention with a mineral or organic acid, or an organic or inorganic base. Such salts are known as acid addition and base addition salts, respectively.

- 25 Acids to form acid addition salts include inorganic acids such as, without limitation, sulfuric acid, phosphoric acid, hydrochloric acid, hydrobromic acid, hydroiodic acid and the like, and organic acids, such as, without limitation, p-toluenesulfonic acid, methanesulfonic acid, oxalic acid, p-bromophenylsulfonic acid, carbonic acid, succinic acid, citric acid, benzoic acid, acetic acid, and the like.

- 30 Base addition salts include those derived from inorganic bases, such as, without limitation, ammonium hydroxide, alkaline metal hydroxide, alkaline earth metal

- 35 -

hydroxides, carbonates, bicarbonates, and the like, and organic bases, such as, without limitation, ethanolamine, triethylamine, tri(hydroxymethyl)aminomethane, and the like. Examples of inorganic bases include, sodium hydroxide, potassium hydroxide, potassium carbonate, sodium carbonate, sodium bicarbonate, potassium bicarbonate, calcium hydroxide, calcium carbonate, and the like.

The compound of the present invention or a salts thereof, depending on its substituents, may be modified to form lower alkylesters or known other esters; and/or hydrates or other solvates. Those esters, hydrates, and solvates are included in the scope of the present invention.

The compound of the present invention may be administered in oral forms, such as, without limitation normal and enteric coated tablets, capsules, pills, powders, granules, elixirs, tinctures, solution, suspensions, syrups, solid and liquid aerosols and emulsions. They may also be administered in parenteral forms, such as, without limitation, intravenous, intraperitoneal, subcutaneous, intramuscular, and the like forms, well-known to those of ordinary skill in the pharmaceutical arts. The compounds of the present invention can be administered in intranasal form via topical use of suitable intranasal vehicles, or via transdermal routes, using transdermal delivery systems well-known to those of ordinary skilled in the art.

The dosage regimen with the use of the compounds of the present invention is selected by one of ordinary skill in the arts, in view of a variety of factors, including, without limitation, age, weight, sex, and medical condition of the recipient, the severity of the condition to be treated, the route of administration, the level of metabolic and excretory function of the recipient, the dosage form employed, the particular compound and salt thereof employed.

The compounds of the present invention are preferably formulated prior to administration together with one or more pharmaceutically-acceptable excipients. Excipients are inert substances such as, without limitation carriers, diluents, flavoring

- 36 -

agents, sweeteners, lubricants, solubilizers, suspending agents, binders, tablet disintegrating agents and encapsulating material.

Yet another embodiment of the present invention is pharmaceutical formulation comprising a compound of the invention and one or more pharmaceutically-acceptable excipients that are compatible with the other ingredients of the formulation and not deleterious to the recipient thereof. Pharmaceutical formulations of the invention are prepared by combining a therapeutically effective amount of the compounds of the invention together with one or more pharmaceutically-acceptable excipients. In making the compositions of the present invention, the active ingredient may be mixed with a diluent, or enclosed within a carrier, which may be in the form of a capsule, sachet, paper, or other container. The carrier may serve as a diluent, which may be solid, semi-solid, or liquid material which acts as a vehicle, or can be in the form of tablets, pills, powders, lozenges, elixirs, suspensions, emulsions, solutions, syrups, aerosols, ointments, containing, for example, up to 10% by weight of the active compound, soft and hard gelatin capsules, suppositories, sterile injectable solutions and sterile packaged powders.

For oral administration, the active ingredient may be combined with an oral, and non-toxic, pharmaceutically-acceptable carrier, such as, without limitation, lactose, starch, sucrose, glucose, sodium carbonate, mannitol, sorbitol, calcium carbonate, calcium phosphate, calcium sulfate, methyl cellulose, and the like; together with, optionally, disintegrating agents, such as, without limitation, maize, starch, methyl cellulose, agar bentonite, xanthan gum, alginic acid, and the like; and optionally, binding agents, for example, without limitation, gelatin, natural sugars, beta-lactose, corn sweeteners, natural and synthetic gums, acacia, tragacanth, sodium alginate, carboxymethylcellulose, polyethylene glycol, waxes, and the like; and, optionally, lubricating agents, for example, without limitation, magnesium stearate, sodium stearate, stearic acid, sodium oleate, sodium benzoate, sodium acetate, sodium chloride, talc, and the like.

- 37 -

In powder forms, the carrier may be a finely divided solid which is in admixture with the finely divided active ingredient. The active ingredient may be mixed with a carrier having binding properties in suitable proportions and compacted in the shape and size desired to produce tablets. The powders and tablets preferably contain from
5 about 1 to about 99 weight percent of the active ingredient which is the novel composition of the present invention. Suitable solid carriers are magnesium carboxymethyl cellulose, low melting waxes, and cocoa butter.

10 Sterile liquid formulations include suspensions, emulsions, syrups and elixirs. The active ingredient can be dissolved or suspended in a pharmaceutically acceptable carrier, such as sterile water, sterile organic solvent, or a mixture of both sterile water and a sterile organic solvent.

15 The active ingredient can also be dissolved in a suitable organic solvent, for example, aqueous propylene glycol. Other compositions can be made by dispersing the finely divided active ingredient in aqueous starch or sodium carboxymethyl cellulose solution or in a suitable oil.

20 The formulation may be in unit dosage form, which is a physically discrete unit containing a unit dose, suitable for administration in human or other mammals. A unit dosage form can be a capsule or tablets, or a number of capsules or tablets. A "unit dose" is a predetermined quantity of the active compound of the present invention, calculated to produce the desired therapeutic effect, in association with one or more excipients. The quantity of active ingredient in a unit dose may be
25 varied or adjusted from about 0.1 to about 1000 milligrams or more according to the particular treatment involved.

Typical oral dosages of the present invention, when used for the indicated effects, will range from about 0.01mg/kg/day to about 100mg/kg/day, preferably from
30 0.1 mg/kg/day to 30 mg/kg/day, and most preferably from about 0.5 mg/kg/day to about 10 mg/kg/day. In case of parenteral administration, it has generally proven

- 38 -

advantageous to administer quantities of about 0.001 to 100 mg/kg/day, preferably from 0.01 mg/kg/day to 1mg/kg/day. The compounds of the present invention may be administered in a single daily dose, or the total daily dose may be administered in divided doses, two, three, or more times per day. Where delivery is via transdermal forms, of course, administration is continuous.

Examples

The present invention will be described in detail below in the form of examples, but they should by no means be construed as defining the metes and bounds of the present invention.

In the examples below, all quantitative data, if not stated otherwise, relate to percentages by weight.

¹H NMR spectra were recorded using either Bruker DRX-300 (300 MHz for ¹H) spectrometer or Bruker 500 UltraShield™ (500 MHz for ¹H). Chemical shifts are reported in parts per million (ppm) with tetramethylsilane (TMS) as an internal standard at zero ppm. Coupling constant (J) are given in hertz and the abbreviations s, d, t, q, m, and br refer to singlet, doublet, triplet, quartet, multiplet, and broad, respectively. The mass determinations were carried out by MAT95 (Finnigan MAT).

Liquid Chromatography - Mass spectroscopy (LC-MS) data were recorded on a Micromass Platform LC with Shimadzu Phenomenex ODS column (4.6 mm φ X 30 mm) flushing a mixture of acetonitrile-water (9:1 to 1:9) at 1 ml/min of the flow rate. Mass spectra were obtained using electrospray (ES) ionization techniques (Micromass Platform LC). TLC was performed on a precoated silica gel plate (Merck silica gel 60 F-254). Silica gel (WAKO-gel C-200 (75-150 μm)) was used for all column chromatography separations. All chemicals were reagent grade and were purchased from Sigma-Aldrich, Wako pure chemical industries, Ltd., Tokyo kasei kogyo Co., Ltd., Nacalai tesque, Inc., Watanabe Chemical Ind. Ltd., Maybridge plc, Lancaster Synthesis Ltd., Merck KGaA, Kanto Chemical Co., Ltd.

The effects of the compounds of the present invention were examined by the following assays.

[Determination of IC₅₀ values of compounds in kinase assay of PI3K γ]

Chemicals and assay materials

Phosphatidylinositol (PtdIns) and phosphatidylserine (PtdSer) were purchased from
5 DOOSAN SERDARY RESEARCH LABORATORIES (Toronto, Canada). Recombinant
human PI3K γ (full length human PI3K p110 γ fused with a His₆-tag at the C-terminus
expressed in *S. frugiperda* 9 insect cells) was obtained from ALEXIS BIOCHEMICALS
(#201-055-C010; San Diego, CA). [γ ³³P]ATP and unlabeled ATP were purchased
from AMERSHAM PHARMACIA BIOTECH (Buckinghamshire, UK) and ROCHE
10 DIAGNOSTICS (Mannheim, Germany), respectively. Scintillation cocktails and
MicroScint PSTM were purchased from PACKARD (Meriden, CT). MaxisorpTM plates
were purchased from NALGE NUNC INTERNATIONAL K.K. (Tokyo, Japan). All other
chemicals not further specified were from WAKO PURE CHEMICALS (Osaka, Japan).

15 *Solid-Phase Lipid Kinase Assay*

To assess inhibition of PI3K γ by compounds, the MaxisorpTM plates were coated
with 50 μ l/well of a solution containing 50 μ g/ml PtdIns and 50 μ g/ml PtdSer
dissolved in chloroform:ethanol (3:7). The plates were subsequently air-dried by
20 incubation for at least 2 hours in a fume hood. The reaction was set up by mixing
25 μ l/well of assay buffer 2x (100 mM MOPSO/NaOH, 0.2 M NaCl, pH 7.0, 8 mM
MgCl₂, 2 mg/ml BSA (fatty acid-free)) and 50 ng/well PI3K γ in the lipid pre-coated
plate and 10x test compounds were added in 2% DMSO. The reaction was started by
adding 20 μ l/well of ATP mix (final 10 μ M ATP; 0.05 μ Ci/well [γ ³³P]ATP). After
25 incubation at RT for 2 hours, the reaction was terminated by adding 50 μ l/well stop
solution (50 mM EDTA, pH 8.0). The plate was then washed twice with Tris-
buffered saline (TBS, pH 7.4). MicroScint PSTM (PACKARD) scintillation mix was
added at 100 μ l/well, and radioactivity was counted by using a TopCountTM
(PACKARD) scintillation counter.

The inhibition percent at each concentration of compound was calculated, and IC50 values were determined from the inhibition of curve.

{Determination of IC50 values of compounds in kinase assay of PI3K β }

Recombinant baculovirus of PI3K β p110 β and GST-p85 α were obtained from Dr. Katada (University of Tokyo). Recombinant PI3K heterocomplex of p110 β and GST-p85 α were co-expressed in insect cells according to manufacture's instruction (Pharmingen, San Diego, CA), and purified with glutathione affinity column. Kinase assay of PI3K β was prepared in a similar manner as described in the part of [Determination of IC50 values of compounds in kinase assay of PI3K γ].

15

[Selectivity test with other kinases]

Kinase selectivity of the compounds was assessed by using a few kinase assays such as kinase assay of Syk.

20

{Syk tyrosine kinase inhibitory assay for selectivity}

(1) Preparation of Syk protein

A cDNA fragment encoding human Syk openreading frame was cloned from total RNA of human Burkitt's lymphoma B cell lines, Raji (American Type Culture Collection), with the use of RT-PCR method. The cDNA fragment was inserted into pAcG2T (Pharmingen, San Diego, CA) to construct a baculovirus transfer vector. Then the vector, together with the linearized baculovirus (BaculoGoldTM, Pharmingen), was used to transfect Sf21 cells (Invitrogen, San Diego, CA).

30

- 42 -

Generated recombinant baculovirus was cloned and amplified in Sf21 cells. Sf21 cells were infected with this amplified high titer virus to produce a chimeric protein of Syk kinase fused by glutathione-S-transferase (GST).

5 The resulting GST-Syk was purified with the use of glutathione column (Amersham Pharmacia Biotech AB, Uppsala, Sweden) according to the manufacturer's instruction. The purity of the protein was confirmed to be more than 90% by SDS-PAGE.

10 (2) Synthesize of a peptide

Next, a peptide fragment of 30 residues including two tyrosine residues, KISDFGLSKALRADENYYKAQTHGKWPVKW, was synthesized by a peptide synthesizer. The N-terminal of the fragment was then biotinylated to obtain
15 biotinylated activation loop peptide (AL).

(3) The measurement of Syk tyrosine kinase activity

All reagents were diluted with the Syk kinase assay buffer (50 mM Tris-HCl (pH
20 8.0), 10 mM MgCl₂, 0.1 mM Na₃VO₄, 0.1% BSA, 1 mM DTT). First, a mixture (35 µl) including 3.2 µg of GST-Syk and 0.5 µg of AL was put in each well in 96-well plates. Then 5 µl of a test compound in the presence of 2.5% dimethyl sulfoxide (DMSO) was added to each well. To this mixture was added 300 µM ATP (10 µl) to initiate the kinase reaction. The final reaction mixture (50 µl) consists of 0.65 nM
25 GST-Syk, 3 µM AL, 30 µM ATP, a test compound, 0.25% DMSO, and a Syk kinase assay buffer.

The mixture was incubated for 1 hour at room temperature (RT), and the reaction was terminated by the addition of 120 µl of termination buffer (50 mM Tris-HCl (pH
30 8.0), 10 mM EDTA, 500 mM NaCl, 0.1% BSA). The mixture was transferred to streptavidin-coated plates and incubated for 30 minutes. at room temperature to

combine biotin-AL to the plates. After washing the plates with Tris-buffered saline (TBS) (50 mM Tris-HCl (pH 8.0), 138 mM NaCl, 2.7 mM KCl) containing 0.05% Tween-20 for 3 times, 100 μ l of antibody solution consisting of 50 mM Tris-HCl (pH 8.0), 138 mM NaCl, 2.7 mM KCl, 1% BSA, 60 ng/ml anti-phosphotyrosine monoclonal antibody, 4G10 (Upstate Biotechnology), which was labeled with europium by Amersham Pharmacia's kit in advance, was added and incubated at room temperature for 60 minutes. After washing, 100 μ l of enhancement solution (Amersham Pharmacia Biotech) was added and then time-resolved fluorescence was measured by multi-label counter ARVO (Wallac Oy, Finland) at 340 nm for excitation and 615 nm for emission with 400 msec of delay and 400 msec of window.

[Determination of IC50 values of compounds in superoxide generation from human peripheral mononuclear cells]

Blood (100 ml/donor) was taken from healthy human volunteers by venepuncture with 50 ml syringes containing 50 units heparin. Red blood cells were removed by incubation with 1% (w/v) dextran and 0.45% (w/v) glucose for 30 minutes at room temperature. After centrifugation at 350 xg for 10 minutes, the cell pellet was resuspended in 10 ml PBS. The cell suspension was gently layered on 20 ml of 60% and 20ml of 80% Percoll (Amersham Pharmacia Biotech, Sweden) gradient in PBS in 50 ml tube (#2335-050, Iwaki, Japan). After centrifugation at 400 xg for 30 minutes at room temperature, peripheral polymorphonuclear leukocytes (PMNs) were obtained from the interference between 60% and 80% Percoll phases. After twice washing in PBS, PMNs were suspended at a density of 10^7 cells/ml in Hank's Balanced Salt Solution (HBSS: Nissui, Japan) supplemented by 10 mM Na-Hepes (pH 7.6), 0.1% BSA and kept on ice until further use.

To test inhibition of formyl-methionyl-leucyl-phenylalanine (fMLP)-induced superoxide generation by compounds, PMNs (2×10^5 cells/well) were seeded in HBSS, 10 mM Na-Hepes (pH 7.6), 0.1% BSA in 96-well clear bottom black plate (Cat.#3904, Costar) and pretreated with luminol (1 μ g/well; Sigma) and test

compounds for 10 minutes at 37°C. fMLP peptide (Cat.#4066; Peptide Institute Inc, Japan) was prepared in 10 μ M in the same buffer and prepared in a polypropylene plate (Cat.#3365, Coster). Chemiluminescence (CL) was measured by FDSS-6000 (Hamamatsu Photonics) over 15 minutes after stimulation with 1 μ M fMLP. The percentage of inhibition at each concentration of compound was calculated based on the first peak of CL at approximately 1 minute after addition of stimulus and IC50 values were determined from the inhibition curve.

For opsonized zymosan (OZ) and phorbol 12-myristate 13-acetate (PMA) stimulation, Zymosan A (Sigma) was suspended in HBSS at a concentration of 1 mg/ml and incubated with human pooled serum at a final concentration range of 9 to 80% at 37°C for 30 minutes to opsonize the zymosan, followed by centrifugation at 500 \times g for 10 minutes at 4°C. Then the sediments were washed twice in HBSS and finally resuspended in HBSS to a concentration between 1 and 10 mg/ml. Opsonized zymosan (OZ) was used at 5 mg/ml for stimulation. Phorbol12-myristate 13-acetate (PMA) was initially dissolved at a concentration of 0.1 mg/ml in DMSO as a stock solution and stored frozen at -20°C. PMA solution was prepared from the stock solution by further dilution in HBSS to the concentration of 100 ng/ml. PMNs (2 \times 10⁵ cells/well) were seeded in HBSS, 10 mM Na-Hepes (pH 7.6), 0.1% BSA in 96-well white plate (Packard) and pretreated with luminol (1 μ g/well; Sigma) and test compounds for 10 minutes at 37°C. CL was measured by Arvo counter (Wallac)) at 30 minutes after the stimulation with OZ or PMA. The percentage of inhibition at each concentration of compound was calculated and IC50 values were determined from the inhibition curve.

[Determination of IC50 values of compounds in elastase release from human peripheral mononuclear cells]

To test inhibition of elastase release by compounds, PMNs (5 \times 10⁵ cells/well) were seeded in HBSS supplemented with 10 mM Na-Hepes (pH 7.6), 0.1% BSA in 96-well plate. Cells were pretreated with cytochalasine B (0.1 μ g/well; Nakarai, Japan)

and test compounds in 90 μ l/well for 10 minutes at 37°C. Cells were stimulated with 1 μ M fMLP for 15 minutes at 37°C. Supernatants (40 μ l/well) were collected into 384 well black plate (Packard) to measure elastase activity. Fluorescent-based elastase reaction was started by the addition of 10 μ l of 0.5 mM Suc-Ala-Ala-Ala-MCA (Cat. #3133v; Peptide Institute Inc, Japan) into the 384 well plate at room temperature. The fluorescence emission was measured at 460 nm (λ_{ex} , 360 nm) by using a Wallac-Arvo counter (PerkinElmer, Boston, MA) fluorescence plate reader for 120 minutes. IC50 values of compounds were determined at the initial velocity of the reaction.

[Determination of IC50 values of compounds in chemotaxis assay with the use of human PMNs]

15

Freshly prepared PMNs (1.1×10^7 cells/ml) were incubated with compounds in a polypropylene 96 well plate (Cat.#3365, Coster) for 10 minutes in HBSS supplemented with 10 mM Na-Hepes (pH 7.6), 0.1% BSA. Cells (100 μ l) were incubated with test compounds or vehicle for 30 minutes and were transferred into an Multiwell insert (Cat.# 351183; Falcon) 24w plate. FMLP (10 nM, 0.5 ml) was added into the lower chamber of the plate, and chemotaxis was measured in CO₂ incubator at 37°C for 1 hour. Migrated cells were counted using FACScan (Becton Dickinson, Franklin Lakes, NJ). The percentage of inhibition at the each concentration of compound was calculated, and the IC50 values were determined from the inhibition curve.

(1) cell

30

Human CCR3-transformed L1.2 cells were used. Human CCR3-expressing L1.2 stable transformant was established by electroporation, referring to the methods described in J. Exp. Med. 183:2437-2448, 1996. The human CCR3-transformed L1.2

- 46 -

cells were maintained in RPMI-1640 supplemented with 10% FCS , 100 units/ml of penicillin G and 100 µg/ml of streptomycin, and 0.4 mg/ml of Geneticin. One day before the chemotaxis assay, cells were pretreated with 5 mM sodium butyrate - containing culture medium (5×10^5 cells/ml) for 20-24 hours to increase the expression of CCR3.

(2) Chemotaxis assay

Butyrate-pretreated cells were suspended in chemotaxis buffer (Hanks' solution Cat.#05906 Nissui, 20 mM HEPES pH 7.6, 0.1% human serum albumin Cat.#A-1887 Sigma) at a cell density of 1.1×10^7 cells /ml. A mixture of 90 µl of cell suspension and 10 µl of compound solution diluted with chemotaxis buffer (10-times concentration of the final concentration) were preincubated for 10 minutes at 37°C. The mixture of cells and compounds was added into the upper chamber of the 24-well chemotaxis chamber (Transwell™, Cat.#3421, Costar, pore size; 5 µm). 0.5 ml of 10 nM of human recombinant eotaxin (Cat.#23209, Genzyme Techne) solution, diluted with chemotaxis buffer, was added into the lower chamber of the chemotaxis plate. Then, chemotaxis was performed in CO₂ incubator at 37°C for 4 hours. After 4 hours incubation, migrated cells were counted using FACSscan (Becton Dickinson). The percentage of inhibition at the each concentration of compound was calculated, and IC₅₀ values were determined from the inhibition curve.

[Mouse fMLP-induced pleurisy Model]

Seven weeks old BALB/c female mice were divided into 3 groups, a nontreatment group, a vehicle group and a treatment group. Mice in the treated group were first injected intravenously with compounds of the present invention at varied doses. Mice in the vehicle group were injected with vehicle containing 10% Cremophor EL (Nacalai Tesque) in saline. Three minutes after the treatment, a solution containing 1 mg/mouse of fMLP in 3.3% DMSO in PBS was administrated intrapleurally into a vehicle group and a treated group mice. Four hours after fMLP-injection, mice were

sacrificed and pleural fluid was collected by washing the pleural cavity twice with 2 ml PBS. Total cells per milliliter of pleural fluid were counted using a hemacytometer. Cell differentiation of pleural fluid was determined by counting a minimum of 200 cells from a Giemsa's-stained cytospin slide preparation. Statistical analysis was performed by means of Student's t-test for paired data or analysis of variance with Dunnett's Post test, using GraphPadPRISM for Windows, version 2.01.

For practical reasons, the compounds are grouped in some classes of activity as follows:

In vitro $IC_{50} = A (= \text{or } <) 0.1 \mu\text{M} < B (= \text{or } <) 0.5 \mu\text{M} < C (= \text{or } <) 2 \mu\text{M} < D$

The compounds of the present invention also show strong activity in vivo assays.

Z)-2-(8,9-Dimethoxy-2,3-dihydroimidazo[1,2-c]quinazolin-5-yl)-1-(3-pyridinyl)ethanol

(1) Methyl 3-oxo-3-(3-pyridinyl)propanoate

A 0.5 M solution of potassium hexamethyldisilazide in toluene (22 ml, 11 mmol) was mixed with tetrahydrofuran (5 ml), and the mixture was cooled at -78°C . To the cold (-78°C) mixture was added dropwise a solution of 3-acetylpyridine (1.0 g, 8.26 mmol) in tetrahydrofuran (5 ml). The mixture was warmed to room temperature

and stirred for 3 hours. The mixture was cold at -78°C , and then dimethyl carbonate (1.2 ml, 14.3 mmol) was added dropwise. The resulting solution was allowed to warm to room temperature and stirred overnight. The reaction solution was quenched by adding aqueous 1N HCl solution, and extracted three times with ethyl acetate. The combined organic layers were washed with water and brine, dried over magnesium sulfate, filtrated, and concentrated under reduced pressure. The residue was purified by column chromatography on silica-gel (hexane/ ethyl acetate, 1/1) to give methyl 3-oxo-3-(3-pyridinyl)propanoate (1.0 g, 68% yield) as an oil.

- 10 (2) 2-(4,5-Dihydro-1H-imidazol-2-yl)-4,5-dimethoxyaniline:

- 15 2-Amino-4,5-dimethoxybenzonitrile (5.0 g, 28 mmol) was added to ethylenediamine (7.9 g, 131 mmol) at room temperature. The resulting solution was warmed to 40°C , and a catalytic amount of diphosphorus pentasulfide (50 mg) was added. The mixture was heated to $80-90^{\circ}\text{C}$, and the stirring was continued overnight. The reaction mixture was diluted with water, and the resulting precipitate was collected by filtration to give 2-(4,5-dihydro-1H-imidazol-2-yl)-4,5-dimethoxyaniline (5.1 g, 82 %) as a solid.

- (3) (Z)-2-(8,9-Dimethoxy-2,3-dihydroimidazo[1,2-c]quinazolin-5-yl)-1-(3-pyridinyl)ethanol

- 49 -

A mixture of 2-(4,5-dihydro-1H-imidazol-2-yl)-4,5-dimethoxyaniline (0.15 g, 0.68 mmol) and methyl-3-oxo-3(3-pyridinyl)propanoate (0.20 g, 1.12 mmol) was stirred at 155 °C for 1 hour. The reaction mixture was purified by column chromatography on silica-gel (dichloromethane/ methanol, 25/1) to give (Z)-2-(8,9-dimethoxy-2,3-dihydroimidazo[1,2-c]quinazolin-5-yl)-1-(3-pyridinyl)ethanol (66.9mg, 28%) as a yellow solid.

(2) 4-Hydroxy-3-methoxy-2-nitrobenzaldehyde

A mixture of 4-formyl-2-methoxy-3-nitrophenyl acetate 4.54g (19.0mmol) and potassium carbonate 5.24g (37.9mmol) in methanol 40mL was stirred at room temperature for 2 hours. The reaction mixture was poured into water, acidified by 1N HCl solution and extracted into AcOEt. The organic layer was washed with brine, dried over MgSO₄, filtrated and the solvent was evaporated. The residue was washed with n-hexane to give the title compound 3.60g as white solid. Yield 96.3%.

10 (3) 4-Hydroxy-3-methoxy-2-nitrobenzonitrile

To a mixture of 4-hydroxy-3-methoxy-2-nitrobenzaldehyde 14.5g (73.5mmol) in 28% ammonia solution 150mL and tetrahydrofuran 15mL was added iodine 22.4g (88.2mmol) and stirred at room temperature for overnight. The reaction mixture was concentrated in vacuo. The residue was acidified with 2H HCl solution and extracted into diethyl ether. The organic layer was washed with brine, dried over MgSO₄, filtrated and the solvent was evaporated. The residue was washed with diisopropyl ether to give the title compound 12.1g as brown solid. Yield 84.5%

20 (4) 3-Methoxy-4-(methoxymethoxy)-2-nitrobenzonitrile

A mixture of 4-hydroxy-3-methoxy-2-nitrobenzonitrile 1.00g, chloromethyl methyl ether 0.47mL (6.18mmol) and potassium carbonate 3.56g (25.8mmol) in N,N-

dimethylformamide 10mL was stirred at 50°C for 2 hours. The reaction mixture was poured into water and extracted into diethyl ether. The organic layer was washed with brine, dried over MgSO₄, filtrated and the solvent was evaporated. Silica gel chromatography (n-hexane / AcOEt = 4/1) afforded the title compound 1.03g as colorless solid. Yield 83.5%.

(5) 2-Amino-3-methoxy-4-(methoxymethoxy)benzonitrile

To 5% palladium on activated carbon 6.00g under argon atmosphere was added a solution of 3-methoxy-4-(methoxymethoxy)-2-nitrobenzonitrile 6.00g (25.2mmol) in ethanol 50mL and stirred under hydrogen atmosphere at room temperature for 8 hours. The reaction mixture was filtrated and the filtrate was concentrated in vacuo. Silica gel chromatography (n-hexane / AcOEt = 4/1) afforded the title compound 2.83g as white solid. Yield 53.9%.

15

(6) [6-(4,5-Dihydro-1H-imidazol-2-yl)-2-methoxy-3-(methoxymethoxy)phenyl]amine

A solution of 2-amino-3-methoxy-4-(methoxymethoxy)benzonitrile 475mg (2.28mmol) and phosphorus pentasulfide 25.4mg (0.11mmol) in ethylenediamine 2.75g was stirred at 120°C for overnight. The reaction mixture was cooled to room temperature and poured into water. The precipitate was collected and washed with water to give the title compound 293mg as white solid. Yield 51.1%.

25 (7) Ethyl 3-oxo-3-(pyridin-3-yl)propanoate

- 53 -

To a suspension of nicotinic acid 5.00g (40.6mmol) in tetrahydrofuran 50mL was added carbonyl diimidazole 9.76g (60.9mmol) at 5°C and stirred at room temperature for 1 hour. In a separate flask, a suspension of MgCl₂ 4.64g (48.7mmol) and ethyl malonate potassium salt 10.37g (60.92mmol) in tetrahydrofuran 50mL was stirred at 50°C for 4 hours. To this suspension was added the aforementioned imidazolidine solution at room temperature and stirred for 12 hours. The reaction was quenched by the addition of water and extracted into ethyl acetate. The organic layer was washed by brine, dried over MgSO₄, filtrated and the solvent was evaporated. Silica gel chromatography (n-hexane / AcOEt = 2/1) afforded the title compound 3.89g as pale yellow oil. Yield 49.5%.

(8) 2-[7-Methoxy-8-(methoxymethoxy)-2,3-dihydroimidazo[1,2-c]quinazolin-5-yl]-1-pyridin-3-ylethanol

A solution of [6-(4,5-dihydro-1H-imidazol-2-yl)-2-methoxy-3-(methoxymethoxy)phenyl]amine 1.31g (5.20mmol) and ethyl 3-oxo-3-(pyridin-3-yl)propanoate 1.00g (5.20mmol) in toluene 30mL was refluxed for overnight. The precipitate was collected and washed with diethyl ether to give the title compound 1.52g as a yellow solid. Yield 76.9%.

Example 2-1:

N-(2,3-Dihydroimidazo[1,2-*c*]quinazolin-5-yl)nicotinamide

(1) 2-(4,5-Dihydro-1*H*-imidazol-2-yl)aniline

5

2-Aminobenzonitrile (9.00 g, 76.2 mmol) was added at 0°C to ethylenediamine (25.5 ml, 381 mmol) in small portions with stirring. After phosphorus pentasulfide (200 mg, 0.900 mmol) was added, the mixture was stirred at 100°C overnight. After cooling to 0°C, the reaction was diluted with water. The resulting white precipitate was collected by filtration, washed with water and diethyl ether, and dried under reduced pressure to give 2-(4,5-dihydro-1*H*-imidazol-2-yl)aniline (10.0 g, 81% yield).

10

(2) 2,3-Dihydroimidazo[1,2-*c*]quinazolin-5-ylamine hydrobromide

15

To a suspension of 2-(4,5-dihydro-1*H*-imidazol-2-yl)aniline (5.00 g, 31.0 mmol) in 85% methanol (60 ml) at 0°C was added cyanogen bromide (3.61 g, 34.1 mmol) by portions. This mixture was stirred at room temperature overnight. After the mixture was concentrated under reduced pressure, the resulting precipitate was collected by filtration. This pale green solid was washed with water, methanol and diethyl ether successively, and dried under reduced pressure to give 2,3-dihydroimidazo[1,2-*c*]quinazolin-5-ylamine hydrobromide (4.94 g, 60% yield).

(3) *N*-(2,3-Dihydroimidazo[1,2-*c*]quinazolin-5-yl)nicotinamide

To a suspension of 2,3-dihydroimidazo[1,2-*c*]quinazolin-5-ylamine hydrobromide (500 mg, 1.87 mmol) and nicotinic acid (346 mg, 2.81 mmol) in *N,N*-dimethylformamide (25 ml) at room temperature was added benzotriazole-1-yl-oxy-trispyrrolidino-phosphonium hexafluorophosphate (1.46 g, 2.81 mmol) followed by *N,N*-diisopropylethylamine (1.30 ml, 7.49 mmol). The mixture was heated at 80°C for 4 hours. After cooling to room temperature, the mixture was quenched with aqueous saturated NaHCO₃ solution. The resulting precipitate was collected by filtration, washed with water and diethyl ether, and dried under reduced pressure to give *N*-(2,3-dihydroimidazo[1,2-*c*]quinazolin-5-yl)nicotinamide (450 mg, 83% yield).

Example 2-2:

N-(2,3-Dihydroimidazo[1,2-*c*]quinazolin-5-yl)nicotinamide hydrochloride

5

To a suspension of *N*-(2,3-dihydroimidazo[1,2-*c*]quinazolin-5-yl)nicotinamide (150 mg, 0.515 mmol) in tetrahydrofuran (4 ml) at 0°C was added a 4N solution of hydrochloric acid in 1,4-dioxane (2 ml, 8 mmol). The mixture was stirred at room temperature for 1 h, and concentrated under reduced pressure. The resulting residue was triturated with diethyl ether. The resulting precipitate was collected by filtration, washed with ethyl ether, and dried under reduced pressure to give *N*-(2,3-dihydroimidazo[1,2-*c*]quinazolin-5-yl)nicotinamide hydrochloride (192 mg, quantitative).

Example 2-3:

6-(Acetamido)-N-[8-(morpholin-4-yl)-2,3-dihydroimidazo[1,2-c]quinazolin-5-yl]nicotinamide

5 (1) 4-(Morpholin-4-yl)-2-nitrobenzonitrile

A mixture of 2,4-dinitrobenzonitrile 4.20g (21.75mmol) and morpholine 5.7mL (66.0mmol) in N,N-dimethylformamide 20mL was stirred at room temperature for 20 hours. The reaction mixture was poured into water. The precipitate was collected and washed with water to give the title compound 4.20g as orange solid. Yield 74.5%.

(2) 2-Amino-4-(morpholin-4-yl)benzonitrile

15

To a cooled mixture of tin(II) chloride dihydrate 12.8g (56.7mmol) in conc. HCl 40mL with ice bath was added 4-(morpholin-4-yl)-2-nitrobenzonitrile 4.20 g (16.09mmol) and stirred at room temperature for 2 hours. The reaction mixture was poured into diluted NaOH solution and extracted into ethyl acetate. The organic layer was washed with water and brine, dried over MgSO₄ and the solvent was evaporated. The crude product was washed with diethyl ether to give the title compound 3.13g as off-white solid. Yield 95.0%.

20

- 111 -

(3) [2-(4,5-dihydro-1H-imidazol-2-yl)-5-(morpholin-4-yl)phenyl]amine

To a solution of 2-amino-4-(morpholin-4-yl)benzonitrile 3.65g (18.0 mmol) in ethylenediamine 20mL was added phosphorus pentasulfide 4.00mg (0.018 mmol) and stirred at 140°C for 16 hours. After cooling to room temperature, the solvent was evaporated. The residue was washed with water and diethyl ether to give the title compound 3.70g as off-white solid. Yield 83.5%.

10 (4) 8-(Morpholin-4-yl)-2,3-dihydroimidazo[1,2-c]quinazolin-5-amine hydrobromide

15 To a suspension of [2-(4,5-dihydro-1H-imidazol-2-yl)-5-(morpholin-4-yl)phenyl]amine 3.60g (14.6mmol) in 2-propanol 20mL was added cyanogen bromide 2.32g (21.9mmol) portionwise at 0°C and stirred at 100°C for 2 hours. After cooling to room temperature, the precipitate was collected and washed with diethyl ether to give the title compound 1.20g as yellow solid. Yield 77.5%.

20

(5) 6-(Acetamido)nicotinic acid

A mixture of 6-aminonicotinic acid 5.00g (36.5mmol) and acetic anhydride 3.80mL (40.2mmol) in pyridine 30mL was stirred at 140°C for 24 hours. To the reaction mixture was added ethyl acetate and acidified with diluted HCl solution to pH 2. The organic layer was washed with water and brine, dried over MgSO₄, filtrated and the solvent was evaporated. The residue was washed with diisopropyl ether to give the title compound 1.70g as off-white solid. Yield 26%.

(6) 6-(Acetamido)-N-[8-(morpholin-4-yl)-2,3-dihydroimidazo[1,2-c]quinazolin-5-yl]nicotinamide

To a mixture of 8-(morpholin-4-yl)-2,3-dihydroimidazo[1,2-c]quinazolin-5-amine hydrobromide 105.7mg (0.30mmol), 6-(acetamido)nicotinic acid 81.1mg (0.45mmol) and N,N-diisopropylethylamine 0.26mL (1.50mmol) in N,N-dimethylformamide 2 mL was added PyBOP((1H-1,2,3-benzotriazol-1-yloxy)(tripyrrolidin-1-yl)-phosphonium hexafluorophosphate) 234.2mg (0.45mmol) and stirred at 90°C for 16 hours. After cooling to room temperature, saturated NaHCO₃ solution was added. The precipitate was collected and washed with water, methanol, and diethyl ether to give the title compound 41.1mg as yellow solid. Yield 31.6%.

Example 3-1:

(Z)-2-Imidazo[1,2-c]quinazolin-5-yl-1-(2-thienyl)ethanol

(1) 2-(1H-Imidazol-2-yl)aniline

5

A mixture of 2-(4,5-dihydro-1H-imidazol-2-yl)aniline hydrobromide (50.0 mg, 0.207 mmol) and manganese dioxide (170 mg, 1.96 mmol) in *N,N'*-dimethylpropyleneurea (2.0 mL) was heated at 150. (bath temp.). After 1 hour, the reaction mixture was cooled to room temperature, poured into a solution of hydroxylamine hydrochloride (0.5 g) in water (50 mL), and the resulting mixture was extracted with ethyl acetate. The separated organic layer was washed with brine, dried over magnesium sulfate, filtered, concentrated under reduced pressure. The crude residue was triturated with isopropylether, and the precipitate was removed by filtration. The filtrate was concentrated under reduced pressure, and the residue was purified by preparative thin layer chromatography (silica-gel, ethyl acetate as the eluent) to give 2-(1H-imidazol-2-yl)aniline (20 mg, 61% yield).

20 (2) Ethyl 3-oxo-3-(2-thienyl)propanoate

To a suspension of 2-thiophenecarboxylic acid (6.48 g, 50.57 mmol) in tetrahydrofuran (100 ml) at 5. was added 1,1'-Carbonyldiimidazole (8.61 g,

- 206 -

53.09 mmol) by portions. The mixture was allowed to warm to room temperature, and the stirring was continued for 1 hour. The reaction mixture was added into a suspension mixture of magnesium chloride (4.86 g, 51.07 mmol) and potassium 3-ethoxy-3-oxopropanoate (12.91 g, 75.85 mmol) in tetrahydrofuran (50 ml). After being stirred at 50. for 2 hours and at room temperature overnight, the reaction mixture was poured into water, and then extracted with ethyl acetate. The extract was washed with brine, dried over magnesium sulfate, filtered, and concentrated under reduced pressure. The residue was purified by column chromatography on silica-gel (ethyl acetate/ hexane, 15/85) to give ethyl 3-oxo-3-(2-thienyl)propanoate (7.83 g, 78% yield) as a yellow oil.

(3) (Z)-2-Imidazo[1,2-c]quinazolin-5-yl-1-(2-thienyl)ethenol

A mixture of 2-(1H-imidazol-2-yl)aniline (60.0 mg, 0.38 mmol), ethyl 3-oxo-3-(2-thienyl)propanoate (74.7 mg, 0.38 mmol) and p-toluenesulfonic acid monohydrate (36.1 mg, 0.19 mmol) in toluene (30 ml) was heated at reflux for 2 hours. After cooling to room temperature, the reaction mixture was poured into aqueous saturated NaHCO_3 solution, and the resulting mixture was extracted with ethyl acetate. The extract was washed with brine, dried over magnesium sulfate, filtered, and concentrated under reduced pressure. The residue was purified by column chromatography on silica-gel (ethyl acetate/ hexane, 2/3 - 1/1) to give (Z)-2-imidazo[1,2-c]quinazolin-5-yl-1-(2-thienyl)ethenol (37.0 mg, 33% yield) as a yellow powder.

- (15) The medicament as claimed in claim 14 for prophylaxis and/or treatment of asthma, rhinitis, allergic diseases, autoimmune pathologies, rheumatoid arthritis, Grave's disease, and atherosclerosis.
- 5 (16) The medicament as claimed in claim 10 for prophylaxis and/or treatment of neurodegenerative disorders, Alzheimer's disease, or focal ischemia.
- (17) The medicament as claimed in claim 10 for prophylaxis and/or treatment of diabetes, cancer, myocardial contractility disorders, heart failure, ischemia,
10 pulmonary hypertension, renal failure, or cardiac hypertrophy.
- (18) Use of the fused azolepyrimidine derivative, its tautomeric or stereoisomeric form, or a physiologically acceptable salt thereof as claimed in claim 1 for manufacturing a medicament for the treatment and/or prevention of an
15 inflammatory disorder or disease.
- (19) Use of the fused azolepyrimidine derivative, its tautomeric or stereoisomeric form, or a physiologically acceptable salt thereof as claimed in claim 1 for manufacturing a medicament for the treatment and/or prevention of asthma,
20 rhinitis, allergic diseases, or autoimmune pathologies.
- (20) Use of the fused azolepyrimidine derivative, its tautomeric or stereoisomeric form, or a physiologically acceptable salt thereof as claimed in claim 1 for manufacturing a medicament for the treatment and/or prevention of diabetes,
25 cancer, myocardial contractility disorders, heart failure, ischemia, pulmonary hypertension, renal failure, and cardiac hypertrophy.
- (21) Use of the fused azolepyrimidine derivative, its tautomeric or stereoisomeric form, or a physiologically acceptable salt thereof as claimed in claim 1 for manufacturing a medicament for the treatment and/or prevention of disorder
30 or disease associated with PI3K activity.

- 5 (22) Use of the fused azolepyrimidine derivative, its tautomeric or stereoisomeric form, or a physiologically acceptable salt thereof as claimed in claim 1 for manufacturing a medicament for the treatment and/or prevention of disorder or disease associated with PI3K- γ activity.
- 10 (23) Process for controlling an inflammatory disorder or disease in humans and animals by administration of a PI3K inhibitory effective amount of a compound according to claim1.
- (24) Process for controlling an inflammatory disorder or disease in humans and animals by administration of a PI3K- γ inhibitory effective amount of a compound according to claim1.
- 15 (25) Process for controlling an asthma, rhinitis, allergic diseases, or autoimmune pathologies, in humans and animals by administration of a PI3K- γ inhibitory effective amount of a compound according to claim1.
- 20 (26) Process for controlling a diabetes, cancer, myocardial contractility disorders, heart failure, ischemia, pulmonary hypertension, renal failure, and cardiac hypertrophy, in humans and animals by administration of a PI3K- γ inhibitory effective amount of a compound according to claim1.

A. CLASSIFICATION OF SUBJECT MATTER

IPC 7 C07D487/04 C07D487/06 C07D519/00 A61P29/00

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 7 C07D A61P

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

PAJ, WPI Data, EPO-Internal, CHEM ABS Data

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.

* Special categories of cited documents:

- *A* document defining the general state of the art which is not considered to be of particular relevance
- *E* earlier document but published on or after the international filing date
- *L* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- *O* document referring to an oral disclosure, use, exhibition or other means
- *P* document published prior to the international filing date but later than the priority date claimed

- *T* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- *X* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- *Y* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
- *Z* document member of the same patent family

INTERNATIONAL SEARCH REPORT

PCT/EP 03/10377

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
Although claims 23-26 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☒ Claims Nos.: 1,2 (partly)
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
see FURTHER INFORMATION sheet PCT/ISA/210
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this International application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
☐ No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box I.2

Claims Nos.: 1,2 (partly)

Present claims 1,2 relate to an extremely large number of possible compounds. Support within the meaning of Article 6 PCT and/or disclosure within the meaning of Article 5 PCT is to be found, however, for only a very small proportion of the compounds/products/apparatus/methods claimed. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible. Consequently, the search has been carried out for those parts of the claims which appear to be supported and disclosed, namely those parts relating to the compounds according to present claim 3 which appear to be supported by the description.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
